Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The library was characterised by oligonucleotide fingerprinting
(ONFP) to reduce sequencing redundancy. According to the ONFP
procedure, clones giving the same hybridisation pattern with a
procedure, clones giving the same hybridisation pattern with a
battery of 200 8mer oligonucleotides are grouped into clusters. One
clone per cluster is selected for sequencing. The size of each
cluster is an indicator of the frequency of a transcript in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              One

BB160010A20B08.5 Bee Brain Normalized Library, BB16 Apis mellifera cDNA clone BB160010A20B08 5', mRNA sequence.
                                    Increase. Organ: blood, Vector: pTriplEx2; Site 1: Sfil; Site 2: Sfil; A complementary DNA (cDNA) library from human erythroid precursor cells was constructed using SMART PCR (polymerase chain reaction) cDNA Library construction Kit (Clontech, Palo Alto, CA) according to the manufacturer's directions, but with slight modifications. Briefly, reverse transcription was performed in the presence of 1 umol/L peptide nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 3, A Sequence 13, Sequence 17, Sequence 16, Sequence 16, Sequence 71, Sequence 71, Sequence 75, Sequence 1296

Descuence 42.9. Application US/USISTOLE

Patent NO. 6.380370
GENERAL INFORMATION:
APPLICANT: LYDIN DOUGETE SEAME et al
APPLICANT: LYDIN DOUGETE ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/064, 964
PRICK APPLICATION NUMBER: US 60/065, 779
PRICK FILING DATE: 1997-08-14
PRICK FILING DATE: 1997-08-14
NUMBER OF SEQ ID NOS: 5674
SEQ ID NO 2275
APPLICANT: Tabone, John C.
TITLE OF INVENTION: METHODS FOR IMPROVING THE SEQUENCE
TITLE OF INVENTION: FIDELITY OF SYNTHETIC DOUBLE-STRANDED OLIGONUCLECTIDES
FILE REPERENCE: 3400/08+401
CURRENT APPLICATION NUMBER: US/09/872,761A
CURRENT FILING DATE: 2001-06-01
NUMBER OF SEQ ID NOS: 15
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 1:
LENGTH: 205
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

is gequence 2127, Application US/09134001C
is patent No. 6380370
is general information:
Tile OF INVENTION: WUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT FILING DATE: 1998-08-13
PRIOR FILING DATE: 1998-08-13
PRIOR FILING DATE: 1997-11-08
PRIOR FILING DATE: 1997-08-14
PRIOR FILING DATE: 1997-08-14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 905, Application US/09328352
Patent No. 656258
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 905
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention provides a new prodrug activating agent that comprises: (i) a localization domain (LD; other than a tumor-selective antibody) and a prodrug activating domain (LD); (ii) at least one nucleic acid encoding a cytochrome P450 and under control of at least one constitutive or inducible expression control sequence or (iii) a modified hematopoietic stem cell (WHSC) containing at least one nucleic acid encoding a PAD and under control of elements as in (ii). The prodrug activating agent or vectors that express them, are specifically used to treat tumors, inflammation, atherosclerosis and muscular dystrophy, but may also be used to treat many other conditions, e.g. cerebral malaria, rheumatoid arthritis, or conditions associated with hypoxia, hypoglycemia or ischemia, or to deliver antibiotics, antiviral agents, analgesics, anti-inflammatories, antiviral agents and diagnostic agents in optimize activity of PAD, e.g. by delivering it to selected locations or by delivering it to neighboring cells (bystander effect), and allow a reduction in dose of prodrug, and thus of systemic side-inflacts. Nucleic acids encoding the agent may be expressed selectively in hypoxic cells. Sequences AAZO7752-33 represent primers for amplifying derivatives of human P450 reductase
                                                                                                                                                                                                                                                                                                                                                                   Prodrug; localization domain; tumor-selective antibody; cytochrome P450; prodrug activating domain; modified hematopoietic stem cell; MHSC; tumor; inflammation; atherosclerosis; muscular dystrophy; cerebral malaria; rheumatoid arthritis; hypoxia; ischemia; hypoglycemia; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New prodrug activating agent targeted to selected cells or tissues, particularly hypoxic cells, for treating e.g. tumors or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Griffiths L;

The invention provides a new prodrug activating agent that comprises: (i) a localization domain (LD; other than a tumor-selective antibody) and a product activating domain (PDD); (ii) at least one nucleic acid encoding a cytochrome P450 and under control of at least one constitutive or inducible expression control sequence or (iii) a modified hematopoietic stem eall (MESC) containing at least one nucleic acid encoding a PAD and under control of elements as in (ii). The prodrug activating agent or vectors that express them, are specifically used to treat tumors. Inflammation, atherosolerosis and muscular dystrophy, but may also be used to tream many other conditions, e.g. cerebral malaria, rheumatoid arthritis, or conditions associated with hypoxia, hypoglycemia or ischemia, or to deliver antibiotics, antiviral agents and diagnostic agents. LD optimize activity of PAD, e.g. by delivering it to selected locations or by delivering it to neighboring cells (bystander effect), and allow a reduction in dose of prodrug, and thus of systemic side effects. Nucleic acids encoding the agent may be expressed selectively in hypoxic cells. Sequences AAZO7756-57 represent primers for amplifying human P450 reductase functional fragment
                                                                                                                                                                                                                                                                                       Prodrug; localization domain; tumor-selective antibody; cytochrome P450; prodrug activating domain; modified hematopoietic stem cell; MHSC; tumor; inflammation; atherosclerosis; muscular dystrophy; cerebral malaria; rheumatoid arthritis; hypoxia; ischemia; hypoglycemia; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New prodrug activating agent targeted to selected cells or tissues, particularly hypoxic cells, for treating e.g. tumors or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kan O, Griffiths L;

```
This sequence represents a nuclear localisation signal/anchorless P450R 5 'PCR primer, used with a 3' primer (AAZ19790) in the construction of a vector encoding a fusion protein comprising the similar virus 40 (SV40) large T antigen nuclear localisation signal (NLS) and the cytochrome P450 reductase (P450R) derivative, anchorless P450R (AAX42287). Construction of this fusion protein allows retargetting of P450R activity to the nucleus. Many drugs' sites of action are in the nucleus. Tather than the cytoplasm, where P450R normally functions. P450R or its derivatives can be used to activate prodrugs to their active form via reduction.

Comparation of a prodrug is useful where the active drug may be metabolised before it reaches its site of action or where the active drug is sytotoxic, e.g., anticancer drugs. P450R derivative fusion proteins, inflammation, atherosclerosis and muscular dystrophy, but may also be used to treat many other conditions, e.g., cerebral malaria, rheumatoid arthritis, or conditions associated with hypoxia, ischaemia or hyposlyvemia, or to deliver antibiotics, antiviral agents, analgence; anterpretic agents and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ·.

This sequence represents a nuclear localisation signal/P450R FN fragment construction of a vector encoding a fusion protein comprising the similar virus 40 (8740) larger antiquent unclear localisation signal (NLS) and the cytochrome P450 reductase (P450R) derivative, P450R FN fragment (AAM42288). Construction of this fusion protein allows retargetting of P450R activity to the nucleus. Many drugs' sites of action are in the nucleus. Tather than the cytoplasm, where P450R normally functions. P450R or its derivatives can be used to activate prodrugs to their active form via reduction. Administration of a prodrug is useful where the active drug may be metabolised before it reaches its site of action or where the active drug is sytotoxic, e.g., anticancer drugs. P450R derivative fusion proteins, or vectors that express them, are specifically used to treat tumours, inflammation, atherosclerosis and muscular dystrophy, but may also be used to treat many other conditions, e.g., cerebral malaria, rheumatoid architis, or conditions associated with hypoxia, ischaemia or retrivital agence, anti-inflammatories, anti-viral agence, analgence, analgence, analgence, analgence, anti-order and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                  targetting; localisation; cancer; tumour; prodrug; reduction;

The invention relates to a novel device for diagnosis, prognosis and monitoring of therapy having, on its surface, sequences of some or all of specified mnorocyte-macrophage genes and also of other genes or RNA complementary to the specified genes. The device of the invention may be used to determine gene expression profiles for measurement of monocyte or macrophage activation or inflammation in blood or other tissues, as well as for the diagnosis, prognosis and monitoring therapy in cases of induced inflammation, arteriosclerosis, tumours, organ or tissue transplants and sepsis. The device provides information for molecular classification and staging of diasase, oreation of a patient-specific prognostic profile and suggestions about molecular pathogenesis or therapeutic effects, thus facilitating the development of new therapeutic strategies and pharmacological concepts. The current sequence is that of the human BSK DNA of the invention.
                                                                                                                                                                                                                                 Device for diagnosis, prognosis and monitoring therapy of e.g. rheumatoid arthritis, comprises immobilized gene sequences from monocyte-macrophage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequences of fusion which directs nuclear import of the fusion protein in everaryotic cells. The fusion protein in eukaryotic cells. The fusion protein in eukaryotic cells. The fusion proteins of the invention are useful for recombining the DNA molecules of cells or organisms containing recombinase recognition proteins of the invention are useful for studying gene function are various developmental stages and for the creation of transgenic various developmental stages and for the creation of transgenic for the site-specific integration of forcign bNA into the genome of mammalian cells (e.g. for gene therapy). The present DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel fusion protein useful for recombining DNA molecules in eukaryotic cells has recombinase protein which is linked to signal peptide domain which directs nuclear import of fusion protein in eucaryotic cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequences of fusion proteins that contain a recombinase domain and a signal peptide domain which directs nuclear import of the fusion protein in eukaryotic cells. The fusion protein in eukaryotic cells. The fusion proteins of the invention are useful for recombining the DNA molecules of cells or organisms containing recombinase recognition sequences for the recombinase domain of the fusion proteins. The fusion proteins of the invention are useful for studying gene function at various developmental stages and for the creation of transgenic for the site-specific integration of foreign DNA into the genome of mammalian cells (e.g. for gene therapy). The present DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel fusion protein useful for recombining DNA molecules in eukaryotic cells has recombinase protein which is linked to signal peptide domain which directs nuclear import of fusion protein in eucaryotic cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises the amino acid and coding sequences of fusion proteins that contain a recombinase domain and a signal peptide domain which directs nuclear import of the fusion protein in eukaryotic cells. The fusion proteins of the invention are useful for recombining the DNA molecules of cells or organisms containing recombinase recognition sequences for the recombinase domain of the fusion proteins. The fusion proteins of the invention are useful for studying gene function at various developmental stages and for the creation of transgenic organisms. The C31-Int recombination system of the invention can be used for the site-specific integration of foreign DNA into the genome of mammalian cells (e.g. for gene therapy). The present DNA sequence represents a vector that was used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·.

into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous transgenic annear to be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents the positive selection vector construct 03406
                                                                                                                                                                                                                               ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The

The vector comprises of nucleic acid encoding a heterologous protein (like rabies glycoprotein G) linked to a lac operator region, to which the lac repressor binds and represses the expression of heterologous protein. The eukaryotic cell lines can be used for replicating recombinant adenoviral vectors by inhibiting production of certain viral-proteins whose overexpression inhibits the production of viruses. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant eukaryotic cells, containing a polynuclectide encoding a repressor protein and an expression vector that produces a heterologous

ï
is recombinant plasmid pMPG3. It comprises of El region- deleted adenoviral genome, lac repressor (LAP348) gene, Simian virus 40 derived Poly A addition sequence, transcription activation domain from Herpes simplex virus type 1 VPIG, human cytomegalovirus (HCMV) promoter and a copy of adenovirus inverted terminal repeats (ITR8). These plasmids can be used to transfect eukaryotic cells. (Updated on 06-AUG-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lated nucleic acids and polypeptides, useful for preventing diagnosing treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to sytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymocleotides and polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or restament of cancer, laukaemia, nervous system disorders, arthrits and inflammation. Note: The sequence data for this patent did not form part dit he printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention describes a targeting vector (positive selection vector)

(I) capable of modifying a target gene. (I) comprises two sequences (S1 and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (I) is useful for producing cells comprising a modification of the target gene which involves introducing (I) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (I) for enriching cells comprising disruption or modification of target gene enhances recovery of
                                                                                                                                                                                                                                                                                                       ö
cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous transgenic animals containing targeted gene modifications of transgenic animals containing targetted gene modifications. This sequence represents the SV40 large T antigen nuclear localisation signal in corporated into the positive selection vector constructs described in
                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                          9

cells having targeting vector integrated via homologous recombination into the genomes of the cells. (I) is capable of modifying target gene in a cell with high efficiency and specificity. Use of (I) provides a faster and more efficient means for isolating and selecting cells comprising target gene modification. Also use of (I) provides an increase over previous technologies in both the speed and frequency at which homologous recombination events can be recovered. (I) is also useful for creation of transgenic animals containing targetted gene modifications. This sequence represents an oligonuclectide used in the creation of the positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a targeting vector (positive selection vector)

(1) capable of modifying a target gene. (1) comprises two sequences (S1 and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (1) is useful for producing cells comprising a modification of the target gene which involves introducing (1) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (1) for enriching cells comprising disruption or modification of target gene enhances recovery of cells having targeting vector integrated via homologous recombination
                                                                                                                                                                                                                                                                                              09
                                                                                                                                                                                                                                                                                                                             62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene modifications.

RESULT 1 ABK49510 ID ABK4

The invention describes a targeting vector (positive selection vector) (1) capable of modifying a target gene. (1) comprises two sequences (S1 and S2) homologous to a portion or region of a target gene, a selectable marker cassette and a regulator. (1) is useful for producing cells comprising a modification of the target gene which involves introducing (1) into cells capable of homologous recombination, selecting for cells expressing the selectable marker and identifying cells containing the modification of the target gene. Use of (1) for enriching cells comprising disruption or modification of target gene enhances recovery of Novel targeting vector modifying target gene, has first and second sequences homologous to target gene portions, a selectable marker cassette and regulator, useful for producing animals with targeted gene modifications. Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Gene and Region of Sequence similarity are identified by BLAST (Nor. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality fo a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tottotttoa (g) ataacaaaaa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         agaaaagaa (a) ctgtgcctgt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are o sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                            SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                        QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found
                                                                                                                                                                                                                                                          nttp://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html.
flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /rpt_family="MIR"

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequence and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Old a local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RFI1-515K12; the clone sequenced to the right is ACO26337. Actual start of this clone is at base position 1 of RFI1-279E17; actual end is at base position 169991 of

position 1 RP11-279E17

RP11-279E17 contains a transposon in the growth of the clone that has been omitted from the submitted sequence. It would insert after base 95823. Polymorphisms exist between RP11-279E17 and

Submitted (04-JUL-2002) Wellcome Trust Sanger Institute, Hinxton, Cambrited (04-JUL-2002) Wellcome Trust Sanger Institute, Hinxton, humguery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk on Jun 3, 2000 this sequence version replaced gi.7767982.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the corresponding to the overlapping clone name. Note that the corresponding to the overlapping clone, as we submit sequences with The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw.; SwisserOf; Tr.; Trembl.; Wp.; WORMPEP; Information thtp://www.sanger.ac.uk/Projects/Calegans/wormpep This sequence to the was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 http://www.sanger.ac.uk/HGPChr20

This sequence is the entire insert of clone RPII-243J16 The true left end of clone RPII-141719; at 124573 in this sequence. The RPII-243J16 is from the library RPCI-II: constructed by the group of Pieter de Jong. Por further details see http://www.chori.org/bacpac/home.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                               Eukaryoča, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

                                                                                                                                                                                                                                                                                   NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
